

Becoming AI-Augmented - The Integrity Packet

Becoming AI-Augmented

The Integrity Packet

A practical breakout for trustworthy AI-assisted work

From AI Assistant to AI-Augmented

- The shift is not better prompting.
- It is making your judgment visible, transferable, and trustworthy.
- By the end, you will have a first Integrity Packet for real work.

Trustworthy work is work another person can inspect.

The question for the next 45 minutes

AI can help you produce an answer quickly.

Can another qualified person understand what the answer means, challenge it, approve it, and act safely?

That is the difference between AI-assisted output and AI-Augmented work.

AAOS: the operating system around the work

AAOS gives the individual a repeatable path from posture to reliable, scalable work.

There is one common artifact that is used in every STage of the AAOS.

The integrity packet

Where the Integrity Packet fits

- 1 Diagnose the task and its consequence
- 2 Activate AI with bounded context and named sources
- 3 Control the work with evidence, validation, ownership, and risk
- 4 Execute a result another person can review and use

The packet is the bridge from using AI as an assistant to operating as AI-Augmented.

The Assistant Pattern

Common failure mode

- 1 AI drafts
- 2 You skim
- 3 The work looks polished
- 4 The reasoning stays private

The work may look complete, but the reasoning cannot travel.

The AI-Augmented pattern

Better operating pattern

AI accelerates the work, while you remain accountable for the judgment.

- ✓ Outcome is explicit
- ✓ Evidence is named and traceable
- ✓ Assumptions are visible
- ✓ Validation is recorded
- ✓ Ownership and approval are clear
- ✓ Risk and escalation are defined

The transfer test

Could a qualified reviewer who was not involved in drafting:

- ✓ understand the work
- ✓ challenge the important claims
- ✓ approve or reject the result
- ✓ act safely

Use only what is in the record.

The Integrity Packet

A lightweight proof trail attached to consequential work.

It turns private intent into public evidence.

- 1 Outcome
- 2 Assumptions
- 3 Evidence
- 4 Validation
- 5 Ownership
- 6 Risk

Six fields that make trust visible

- **Outcome**: What decision, recommendation, or result is being produced?
- **Assumptions**: What must be true, and where did expert judgment override the default?
- **Evidence**: Which named sources ground the work?
- **Validation**: What did you manually check, stress-test, or red-team?
- **Ownership**: Who is accountable for the decision and approval?
- **Risk**: What could fail, and what is the escalation path?

Example Integrity Packet

Scenario: An AI-assisted recommendation to pause contractor spending for eight weeks while a budget variance is investigated.

The packet lets a reviewer see what the recommendation is, where it came from, what was checked, and what must happen before action.

Example Integrity Packet (cont)

- **Outcome:** Recommend the pause for Cost Center 410, preserving safety-critical contracts.
- **Assumptions:** Current run rate continues; pending invoices are included in the forecast.
- **Evidence:** August finance report, approved contract register, and the open-invoice export.
- **Validation:** Recalculated the variance against the ledger and asked a finance reviewer to challenge excluded costs.
- **Ownership:** Jordan Lee, Finance Director; CFO approval required before action.
- **Risk:** Pending invoices may be incomplete. Recheck the forecast before extending the pause.

Short-form Integrity Packet

A two-line footer for the end of an email or document:

Outcome—pause Cost Center 410 contractor spend for 8 weeks; **Evidence**—August finance report, contract register, and open-invoice export; **Validation**—ledger variance recalculated; **Owner**—Jordan Lee. **Risk**: Pending invoices may be incomplete; **Approval**—CFO before action; Recheck forecast before extending the pause.

Short form does not remove accountability. It makes the minimum record visible where the decision travels.

A prompt that produces a packet

- Assist with [workflow] for [audience].
- Outcome: produce [decision, recommendation, or draft].
- Sources: use only [named sources or systems].
- Show: assumptions, evidence references, uncertainty, and failure modes.
- Validate: identify what I must check or approve myself.
- Stop: ask when evidence, authority, or ownership is missing.
- Return: the work plus a six-part Integrity Packet.

Practice: choose consequential work

Hands-on practice

Choose one real or provided workflow where a polished mistake would create cost, risk, delay, or loss of trust.

- purchasing or vendor selection
- finance or budget analysis
- HR or personnel communication
- administration or policy guidance

<https://ai-augmented.ai/framework/aaos/activate/integrity-packet>

Practice: build the first packet (10 minutes)

1. State the outcome and consequence.
2. Give AI bounded context and named source material.
3. Record assumptions before accepting the draft.
4. Validate the claims that matter.
5. Name the owner, approver, risk, and escalation path.

The goal is a usable first packet, not a perfect document.

Practice: run the transfer test

Peer review

Exchange packets with a partner. The reviewer answers without asking the author for private context:

- ✓ What is the decision or result?
- ✓ What evidence supports it?
- ✓ What remains uncertain?
- ✓ What must be approved before action?

The first incomplete answer is the next improvement.

Close

AI augmentation expands capability when human judgment, evidence, and accountability remain visible.

One practice I will adopt this week:

What changes after the packet

Before

- You defend a polished answer with your reputation.
- Review depends on the author being present.
- Speed hides the cost of rechecking.

After

- The work carries its own evidence trail.
- Review becomes faster and more specific.
- Your judgment can travel without losing accountability.

Your next AI-Augmented practice

This week

Attach an Integrity Packet to one consequential piece of work.

Start small:

- ✓ one decision
- ✓ six fields
- ✓ one human validation pass
- ✓ one named owner

AI-Augmented work begins when your judgment becomes visible.

Continue the conversation

The AAOS gives you the operating path.

The Integrity Packet gives you a repeatable unit of trustworthy work.

One practice I will adopt this week:
